

An upgrade to California's water storage infrastructure is long overdue to restore flexibility and adapt to future uncertainties and changing priorities. The reality of a changing climate – flashier rain storms, less snowpack, and longer, more intense stretches of drought, make it harder for the existing system to capture water for use in drier years. Simply put, the state's existing water infrastructure is challenged to meet our human and environmental needs. A portfolio of solutions must be developed to improve water supply resiliency, including new surface water storage. Sites Reservoir, which is strategically located to support existing infrastructure, will provide significantly more water during drier periods. The reservoir will complement other drought-management tools in addressing California's water management challenges into the 21st century and beyond.

## A FLEXIBLE STORAGE SOLUTION

Sites Reservoir does not rely on snow-melt but captures winter runoff from uncontrolled streams below the existing reservoirs in the Sacramento Valley. Because of this, it will inherently adapt to future climate conditions and will be operated to improve water supply resilience to the predicted changes in weather. Much of the rainfall from extreme events – especially those that occur back-to-back when the ground is saturated – runs off before it can be captured for maximum environmental, urban and agricultural benefit. Sites Reservoir will increase the resiliency of water supplies because it will not rely on spring snowmelt for filling, but instead will capture storm-related runoff and a portion of storm-related flood water.

By operating in conjunction with other California reservoirs, Sites Reservoir substantially increases water supply flexibility, reliability and resiliency in drier years. Deliveries from Shasta, Oroville and Folsom – the northern backbone for State Water Project (SWP) and Central Valley Project (CVP) – are vulnerable to cutbacks during dry years. **Sites Reservoir is the only proposed storage facility in the State of California that will help with statewide operational effectiveness of the SWP and CVP.**

**Sites Reservoir would increase Northern California's water storage capacity by 15 percent by helping to meet increased needs for water when it is needed most during drier periods.**

### FACT:

Sites Reservoir was first proposed decades ago by DWR as a necessary addition to the SWP to maximize operational capacity.

## LOCALLY MANAGED

The Sites Project Authority – a joint powers authority comprised of 11 Sacramento Valley entities – will govern, manage and operate the \$5.2 billion project. The Authority is currently advancing the project's environmental review and permitting, along with preliminary design and operations planning.

For more information, please visit [www.sitesproject.org](http://www.sitesproject.org).

According to a recent report by the California Public Policy Institute, "The best option for increasing supply is capturing and storing additional water from big storms."
